ALEKSANDR KOZLOV

Python Developer | Data & Automation Systems

Amsterdam, Netherlands | +31 638 65 26 49 | alek.volzok@gmail.com | linkedin.com/in/aleksandrkozlov-70a334202

PROFILE

Python developer and technical tools engineer with 10+ years of experience building reliable, performance-sensitive systems for AAA production teams (PUBG Black Budget, Battlefield 2042, FIFA and King's Bounty II). I build data-processing pipelines, automation and internal tools used by technical and non-technical stakeholders, with a practical focus on correctness, observability and throughput.

Alongside production engineering work, I build and operate a Dockerised Python research system for systematic crypto-strategy evaluation: data validation, walk-forward signal generation, backtesting, risk metrics and scheduled research runs. I am looking to bring this combination of Python engineering, performance discipline and stakeholder-facing ownership to a trading technology environment.

TECHNICAL SKILLS

Python & data: Python, pandas, NumPy, PyTorch, data validation, batch processing, ETL-style pipelines, CSV/time-series processing

Systems & delivery: Docker, Docker Compose, Linux, cron scheduling, TeamCity CI/CD, Git, Perforce, SVN

Performance & tooling: profiling and bottleneck analysis, Unreal Engine commandlets, build automation, internal developer tooling, technical documentation

Additional: C++, C#, SQL fundamentals, REST/API integration, Houdini/VEX, Unreal Engine 5

PROFESSIONAL EXPERIENCE

Senior Technical Artist / Tools Developer - PUBG Black Budget

Mar 2022 - Present | Amsterdam, Netherlands

- Built and maintained Python-based automation and data-processing tooling for large-scale production workflows; reduced repetitive manual work and made performance-sensitive processes repeatable.
- Developed ML-driven Python/PyTorch content-analysis tooling to identify redundant assets and support memory-footprint reduction across the pipeline.
- Delivered automated optimisation workflows with Unreal commandlets, World Partition cell transformers and Python scripts, operating on large content sets.
- Created an in-editor analytics tool for DataLayer and HLOD data, giving engineering and content teams self-service visibility into performance-relevant information.
- Performed recurring performance profiling with PIX and NVIDIA Nsight; converted findings into actionable reports and optimisation work for cross-functional teams.
- Owned technical documentation and knowledge-sharing for Art, Design and QA stakeholders; translated complex system behaviour into practical workflows.

Senior Technical Artist - Sperasoft

Aug 2021 - Mar 2022 | Battlefield 2042, FIFA

- Built internal tools and automation for Blender, Maya and Frostbite, including repeatable weapon-skin setup workflows.

- Partnered with artists and engineers to diagnose pipeline issues and improve asset-production reliability.

Technical Artist - 1C Entertainment

Nov 2019 - Jul 2021 | King's Bounty II

- Automated texture baking, UV generation and asset-import workflows with Python.
- Built procedural tools and reusable systems in Houdini and Unreal Engine 4 for content production at scale.

Earlier Experience - VRTech Group / NAOS / Elephant Games

2011 - 2019

- Developed Python automation for Blender workflows, simulation and real-time systems in Unreal Engine, and led a 3D-content team.

SELECTED PERSONAL PROJECT

Crypto Autoresearch - Dockerised Python Research & Backtesting System

Personal project | 2026 - Present

- Designed and operate a containerised Python 3.12 research service for systematic crypto-strategy evaluation across 15-minute and 1-hour timeframes.
- Implemented data loading and validation for OHLCV time series: schema handling, deduplication, numeric coercion, missing-data filtering, timezone conversion and chronological ordering.
- Built a modular strategy interface and walk-forward signal-generation workflow; strategies are validated before evaluation to prevent malformed trades, invalid prices and overlapping positions.
- Implemented backtesting and risk metrics including trade count, Sharpe ratio, maximum drawdown and win rate, with spread-adjusted long/short returns.
- Packaged the service with Docker and Docker Compose; uses explicit environment configuration, read-only historical-data mounts, writable strategy/results/log volumes, scheduled jobs and restart policies.
- Apply a CI/CD delivery mindset from production tooling: reproducible environments, version control, logs and repeatable runs; TeamCity is part of my production tooling experience.

EDUCATION & CERTIFICATION

Deep Learning Specialization - Coursera | 2022
Python & PyTorch; Convolutional Neural Networks; Structuring Machine Learning Projects; Generative AI (GANs to CLIP)

Penza State University of Architecture and Construction
Specialist Degree, Urban Planning and Architecture | 2007 - 2011
